

Chapter 1

About Science

THE MAIN IDEA

Science is the study of nature's rules

1.6 Measuring with Units

Science starts with observations. When possible, it is helpful to quantify observations by taking measurements. By quantifying observations, we are able to make objective comparisons, share accurate information with others, or look for trends that might reveal some inner workings of nature.

Scientists measure *physical quantities*. Some examples of physical quantities you will be learning about and using in this program are length, time, mass, weight, volume, energy, temperature, heat, and density. Any measurement of a physical quantity must always include a number followed by a unit that tells us not only what was measured but also the scale of the measurement. It would be meaningless, for example, to say that your dog weighs 40, because without a specific unit, no one would know what that meant: 40 ounces, 40 pounds, 40 kilograms? A dog that weighed 40 kg would be more than 35 times heavier than one that weighed 40 oz. Units such as ounces, pounds, and kilograms, or feet, yards, and kilometers are all units that allow us to make meaningful comparisons when we measure physical quantities, and they must be included to complete the description.

There are two major unit systems used in the world today. One is the United States Customary System (USCS, formerly called the British System of Units), used in the United States, primarily for nonscientific purposes.* The other is the *Système International* (SI), which is used in most other nations. This system is also known as the International System of Units or as the metric system. The orderliness of this system makes it useful for scientific work, and it is used by scientists all over the world, including those in the United States. And the International System is beginning to be used for nonscientific work in the United States, as **Figure 1.14** shows. This book uses the SI units given in **Table 1.2**. On occasion, USCS units are also used

READING CHECK

Any measurement of a physical quantity must always include two things. What are they?

* Two other countries that continue to use the USCS are Liberia and Myanmar.

▲ **Figure 1.14**

Various commercial goods are commonly sold in metric quantities.

to help you make comparisons. One major advantage of the metric system is that it uses a decimal system, which means all units are related to the next smaller or larger units by a factor of 10. Some of the more commonly used prefixes, along with their decimal equivalents, are shown in **Table 1.3**. From this table, you can see that 1 kilometer is equal to 1000 meters, where the prefix kilo- indicates 1000. Likewise, 1 millimeter is equal to 0.001 meter, where the prefix milli- indicates 1/1000. You need not memorize this table, but you will find it a useful reference when you come across these prefixes in your course of study.

TABLE 1.2 Metric Units for Physical Quantities and their USCS Equivalents

PHYSICAL QUANTITY	METRIC UNIT	ABBREVIATION	USCS EQUIVALENT
length	kilometer	km	1 km = 0.621 miles (mi)
	meter	m	1 m = 3.285 feet (ft)
	centimeter	cm	1 cm = 0.3937 inches (in.)
	millimeter	mm	1 in = 2.54 cm none commonly used
time	second	s	second also used in USCS
mass	kilogram	kg	1 kg = 2.205 pounds (lb)
	gram	g	1 g = 0.03528 ounces (oz)
	milligram	mg	1 oz = 28.345 g none commonly used
volume	liter	L	1 L = 1.057 quarts (qt)
	milliliter	mL	1 mL = 0.0339 fl oz
	cubic centimeter	cm ³	1 cm ³ = 0.0339 fl oz
energy	kilojoule	kJ	1 kJ = 0.239 kilocalories (kcal)
	joule	J	1 J = 0.239 calories (cal) 1 cal = 4.184 J
temperature	degree Celsius	°C	(°C * 1.8) + 32 = degrees Fahrenheit, °F
	kelvin	K	°C + 273 = K

TABLE 1.3 Metric Prefixes

PREFIX	SYMBOL	DECIMAL EQUIVALENT	EXPONENTIAL FORM	EXAMPLE
<i>tera-</i>	T	1,000,000,000,000.	10 ¹²	1 terameter (Tm) 1 trillion meters
<i>giga-</i>	G	1,000,000,000.	10 ⁹	1 gigameter (Gm) 1 billion meters
<i>mega-</i>	M	1,000,000.	10 ⁶	1 megameter (Mm) 1 million meters
<i>kilo-</i>	k	1000.	10 ³	1 kilometer (km) 1 thousand meters
<i>hecto-</i>	h	100.	10 ²	1 hectometer (hm) 1 hundred meters
<i>deka-</i>	da	10.	10 ¹	1 dekameter (dam) ten meters
no prefix	–	1.	10 ⁰	1 meter (m) 1 meter
<i>deci-</i>	d	0.1	10 ⁻¹	1 decimeter (dm) 1 tenth of a meter
<i>centi-</i>	c	0.01	10 ⁻²	1 centimeter (cm) 1 hundredth of a meter
<i>milli-</i>	m	0.001	10 ⁻³	1 millimeter (mm) 1 thousandth of a meter
<i>micro-</i>	μ	0.000 001	10 ⁻⁶	1 micrometer (μm) 1 millionth of a meter
<i>nano-</i>	n	0.000 000 001	10 ⁻⁹	1 nanometer (nm) 1 billionth of a meter
<i>pico-</i>	p	0.000 000 000 001	10 ⁻¹²	1 picometer (pm) 1 trillionth of a meter
